No. 119      Use of Thermally Conductive Potting/Staking Compounds

Author(s): Carl Taylor & Todd King

Contact: (301) 286-6882

---

Conductive heat transfer from electronic assemblies is particularly important in satellite applications, as heat transfer from air cooling or convection does not occur in the vacuum of space. Thermally conductive materials consisting of epoxies, silicones and polyurethanes are readily available. Typically these polymers are mixed with ceramic or metallic fillers to increase conductivity. The Materials Engineering Branch (MEB) has also fashioned custom materials of its own by adding fillers such as boron nitride, aluminum oxide and powdered metals to increase a polymer's thermal conductivity.

Table 1 is a compilation of thermal conductivity data for some adhesives, potting and staking materials commonly used in spacecraft applications. The table includes the thermal conductivity data reported by manufacturers of the materials and, in most instances, temperature-dependent data measured by the MEB. All MEB measurements were done using the ASTM C-518 "Standard Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Heat Flow Meter." (Note: Thermal conductivity can vary with mix ratio.)

Table 1 also includes the thermal conductivity of materials custom-made in the MEB. Conductivity can be increased by up to a factor of five (compared to the unfilled, cured base material). It should be remembered that fillers will change other material properties such as viscosity, adhesion, tensile strength, and electrical conductivity. The degree of these effects is highly dependent upon the type and quantity of filler added. Any modified material must be evaluated to verify critical performance requirements prior to its use in flight hardware.

Table 1. Thermal Conductivity of Polymeric Thermal Interface Materials

Material Class	Specific Material	Mfr.	Mfr's Data (W/mK)	GSFC Measurements (W/mK)								
				-150 °C (±10%)	-100 °C (±10%)	-50 °C (±10%)	0 °C (±10%)	25 °C (±10%)	50 °C (±10%)	100 °C (±10%)	Other Temperature	Test Date
